

# LegUp™

## Panel-Lifting Accessory for Table Saws

### INSTRUCTIONS

There's really not much to mounting and using it.

The LegUp table saw accessory is designed to be attached (bolted tightly) to one of two places on the table saw:

- 1) to the vertical lip protruding down from the front of the table
- 2) or if your table saw has a fence and the horizontal rail of that fence protrudes beyond the edge of the table, then replacing the standard bracket with the alternate bracket that has been included, attach the LegUp to the lower horizontal lip of the fence rail.

The small black plastic block with self-stick adhesive has been supplied for possible use (if and as needed) as a heel that the sheet stock (panel) can ride on as it is rotating onto the table. Its purpose is to soften the path over a sharp edge should there be one that might gouge, scrape or score the bottom of the panel at the point where it comes in contact with the table or fence rail. Simply remove the paper strip to expose the adhesive on the back of the plastic block and affix it to a suitable location to serve this purpose.

To use the LegUp once mounted simply place the bottom edge of the panel onto the 'hook' at the bottom of the LegUp, then step backwards to the end of the panel and using the LegUp as a fulcrum simply use both hands to rotate or 'flip' the panel onto the table. When you slide the panel to the right on the table the hook of the LegUp will automatically be released from the panel and will drop back down to its vertical resting place. The mechanism on the back of the LegUp is there to serve the purpose of providing a slow, steady return to that vertical position and to keep the 'Leg' from freely swinging back and forth.

We hope and expect you'll enjoy for years the safety and back-saving benefits!
